Conflict of Interest Statement

Alexander Tropsha and Eugene Muratov are co-founders of *Predictive LLC*, which develops novel computer methodologies for the prediction of toxicity endpoints.

All other authors declare no conflicts of interest.

Developmental Toxicity Definition

- Toxicological endpoint for hazard and risk assessment of chemicals affecting fetal growth, structural formation, organ function, or survival before maturity.
- Traditionally evaluated with *in vivo* studies such as the OECD Prenatal Development Toxicity Study (TG 414) and whole embryo culture assays in rats and rabbits.

Challenges of Animal Testing for Developmental Toxicity

- Expensive: \$128,000+

- Time-consuming

- Raises ethical concerns

- Human-relevance uncertainty

US EPA Cost Estimates of Studies for Pesticide Registration. 2018.

Alternatives to Animal Testing

- NAMs: New Approach Methodologies
- NIH Complement-ARIE for NAMs
- QSAR: Quantitative-Structure Activity Relationship

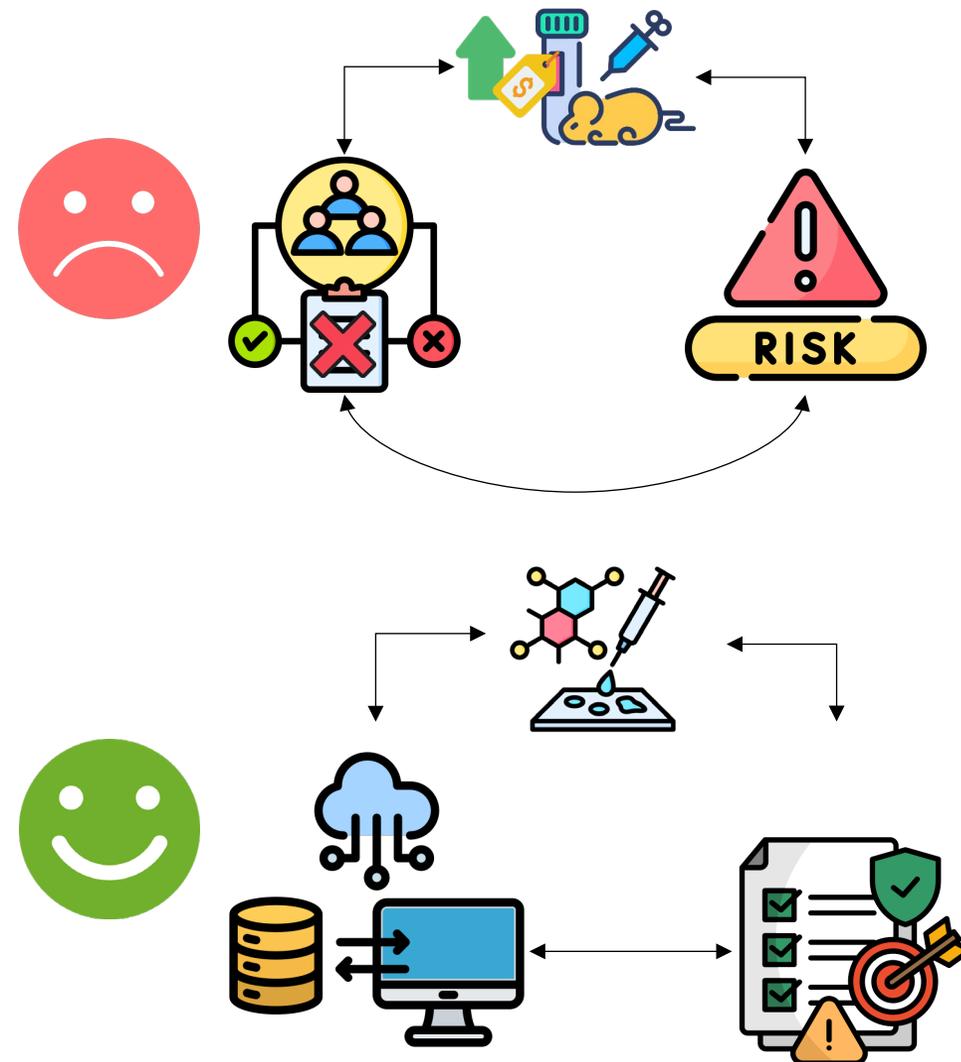

Need for Improved Developmental Toxicity Testing

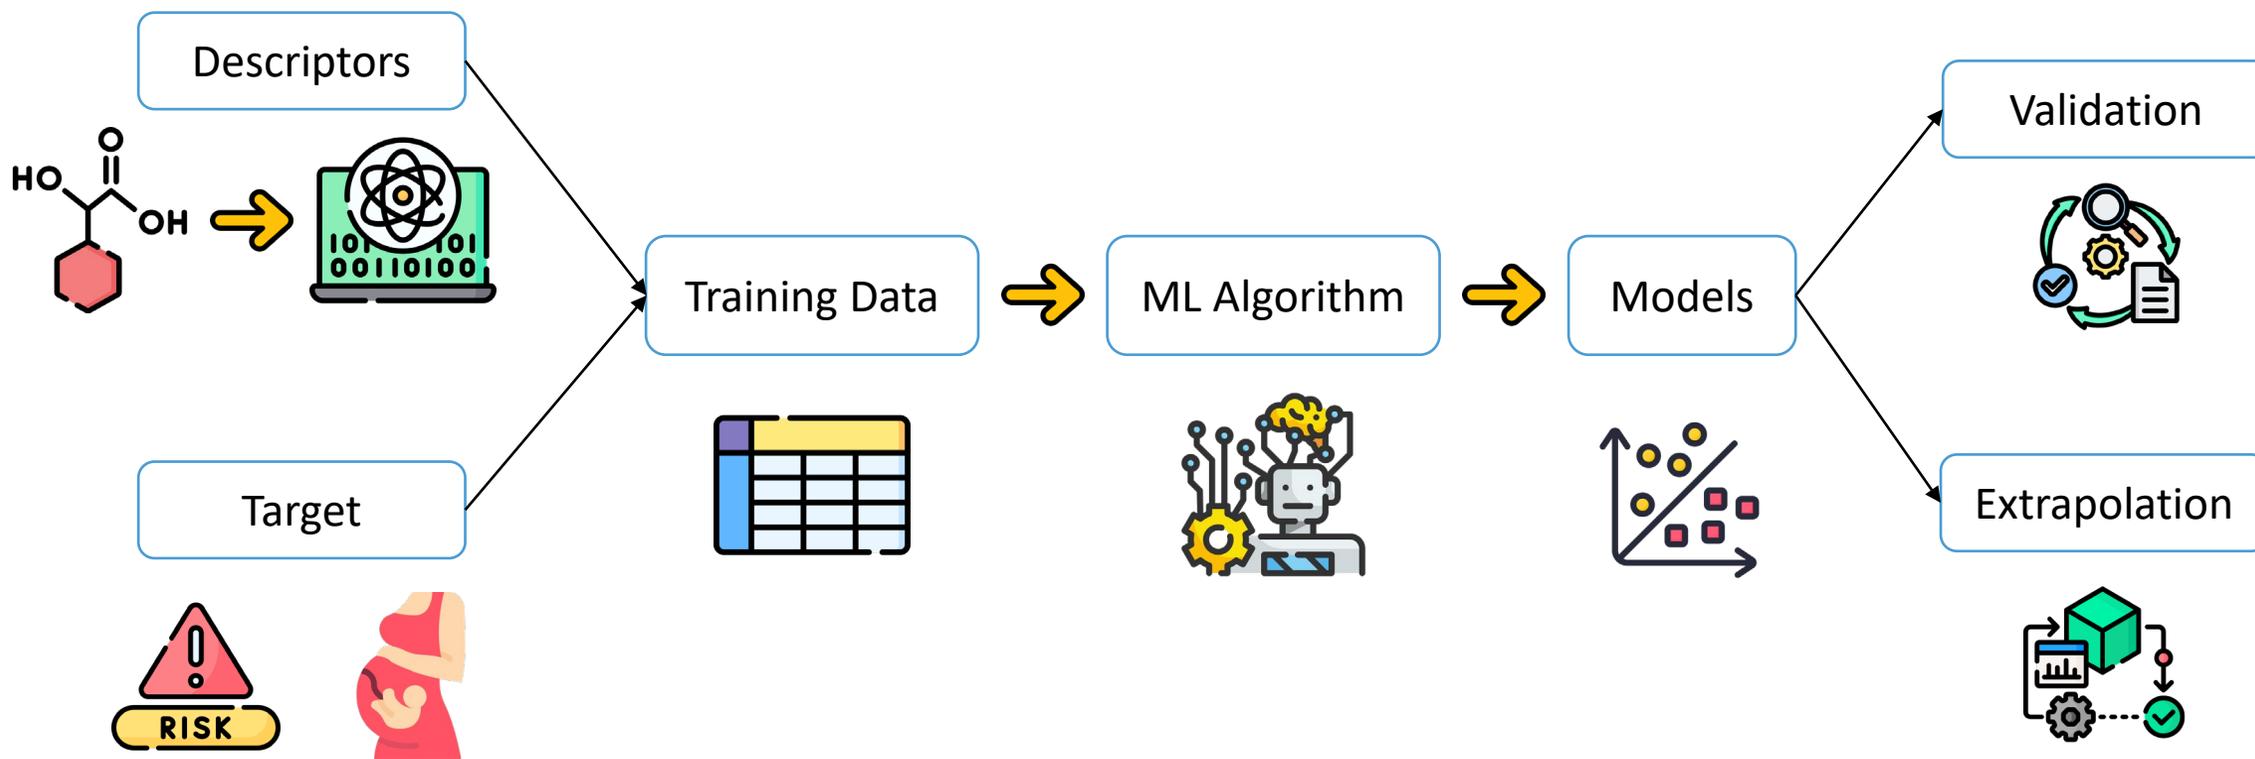

- 80% of pregnant women use prescription medication.¹
- For known teratogens, animals testing only 60% positive predictivity.²
- DeTox offers an *in silico* alternative to animal testing for developmental toxicity

¹Lund, Addiction (2012). ²Niethammer, Development (2022)

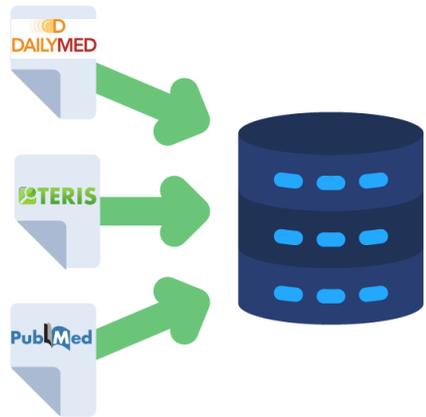

Machine Learning (ML) Overview:

- Analyze impact of many factors on an outcome

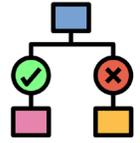

Methodology

Data Collection

Definition of Developmental Toxicants:

- Binary Classifications (developmentally toxic vs. non-toxic)
 - Toxic: Presence of any developmental abnormality
 - Non-toxic: No significant adverse outcomes

- Adverse Outcomes:
 - Malformations, structural abnormalities
 - Spontaneous abortions
 - Cognitive deficits
 - Altered growth
 - Functional/behavioral changes

Schardein, J. L. *Teratogenesis, Carcinogenesis, and Mutagenesis* 1987, 7 (3), 255–271.

Data Collection and Outcome Labeling

47,000 records

Non-toxic + investigated

Removed

Toxic

Category	Definition
A	No risk in human studies
B	No risk in animal studies
C	Risk cannot be ruled out. There are no satisfactory studies in pregnant women, but animal studies demonstrated a risk to the fetus.
D	Evidence of risk (studies in pregnant women have demonstrated a risk to the fetus)
X	Studies in pregnant women have demonstrated a risk to the fetus, and/or human or animal studies have shown fetal abnormalities.

Data Collection and Outcome Labeling

Verification of Non-Toxic Compounds and Trimester-Specific Literature Search

- Literature search
 - “Compound” AND “Trimester” AND “teratogen” or “developmental toxicity”

- Only included studies done under OECD or EPA guidelines
 - Testing done in rabbits, rats, or mice OR
 - Human studies with 50+ individuals

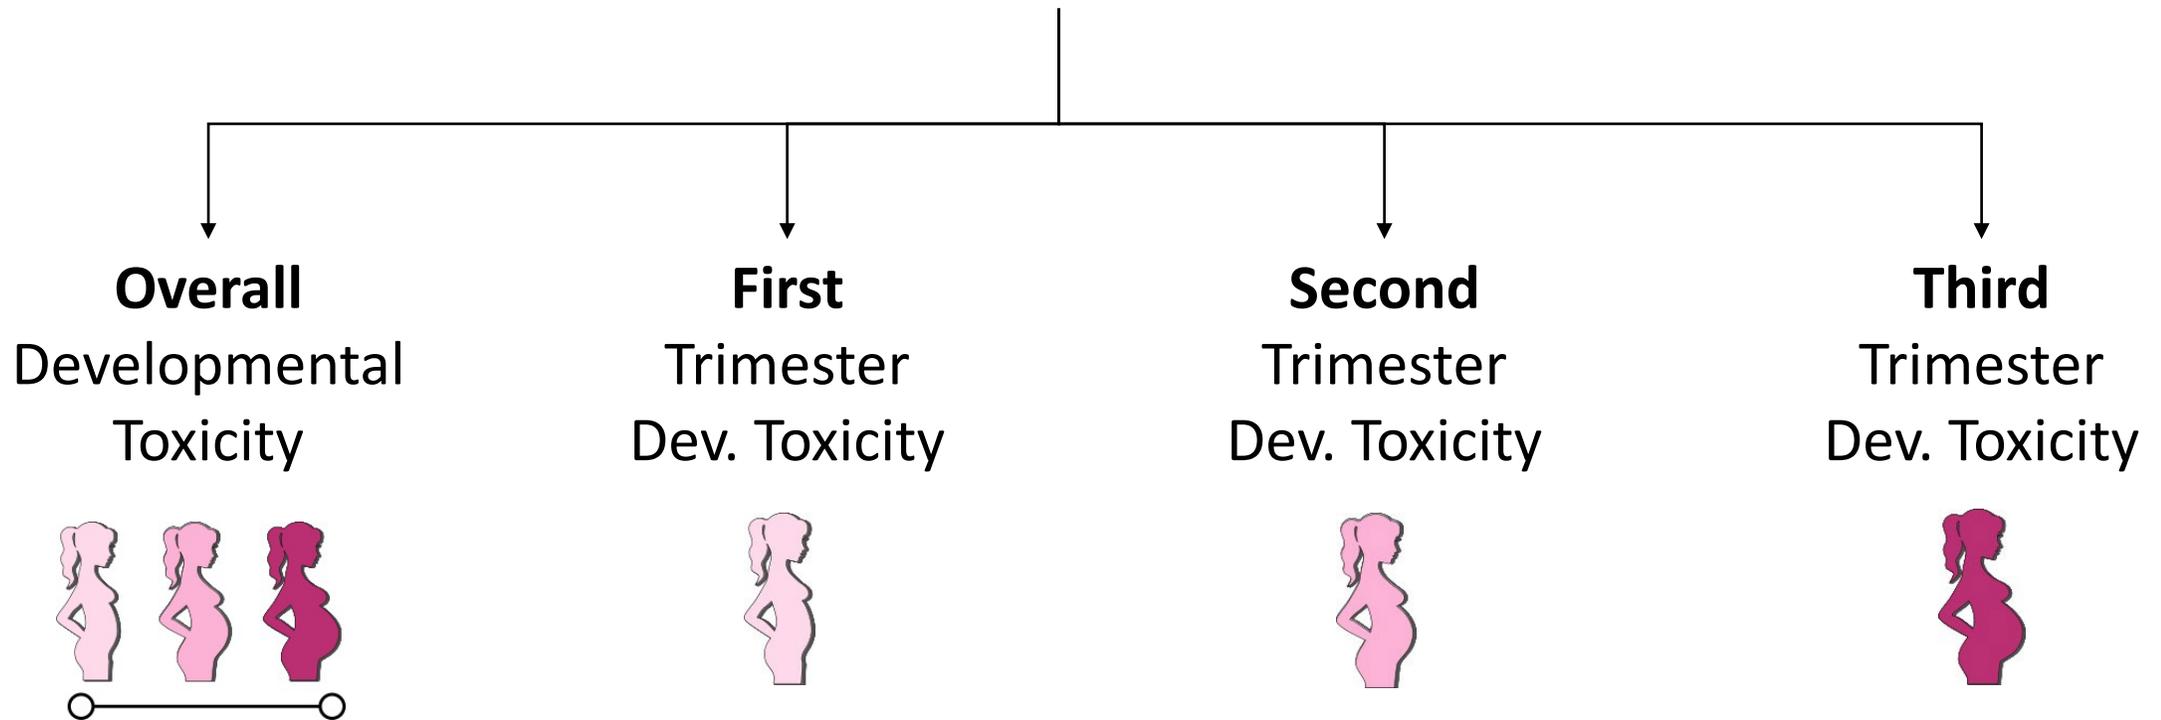

- Updated compound outcome if newer studies showed **any** of the adverse effects linked to developmental toxicity

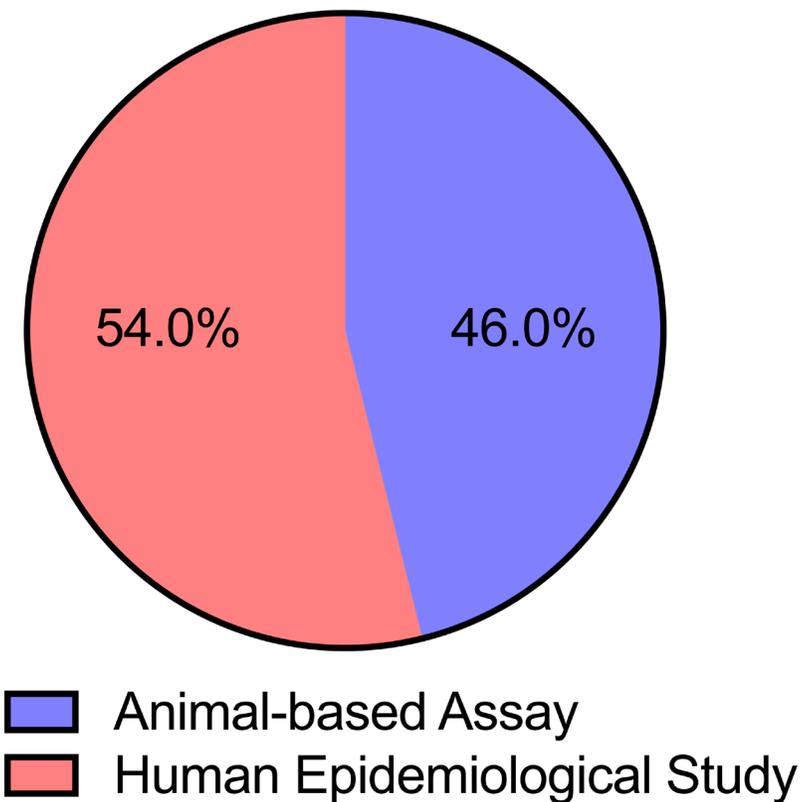

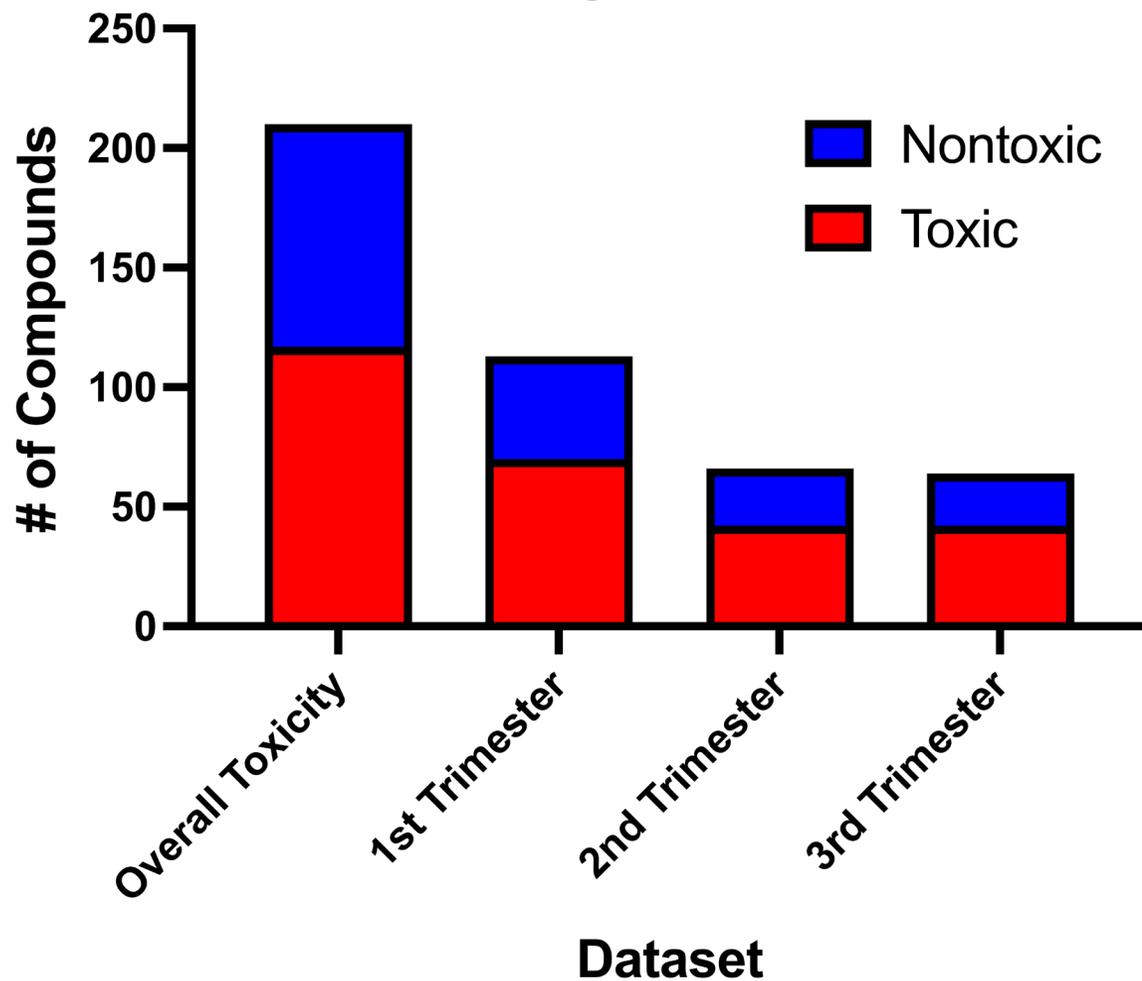

Datasets Summary

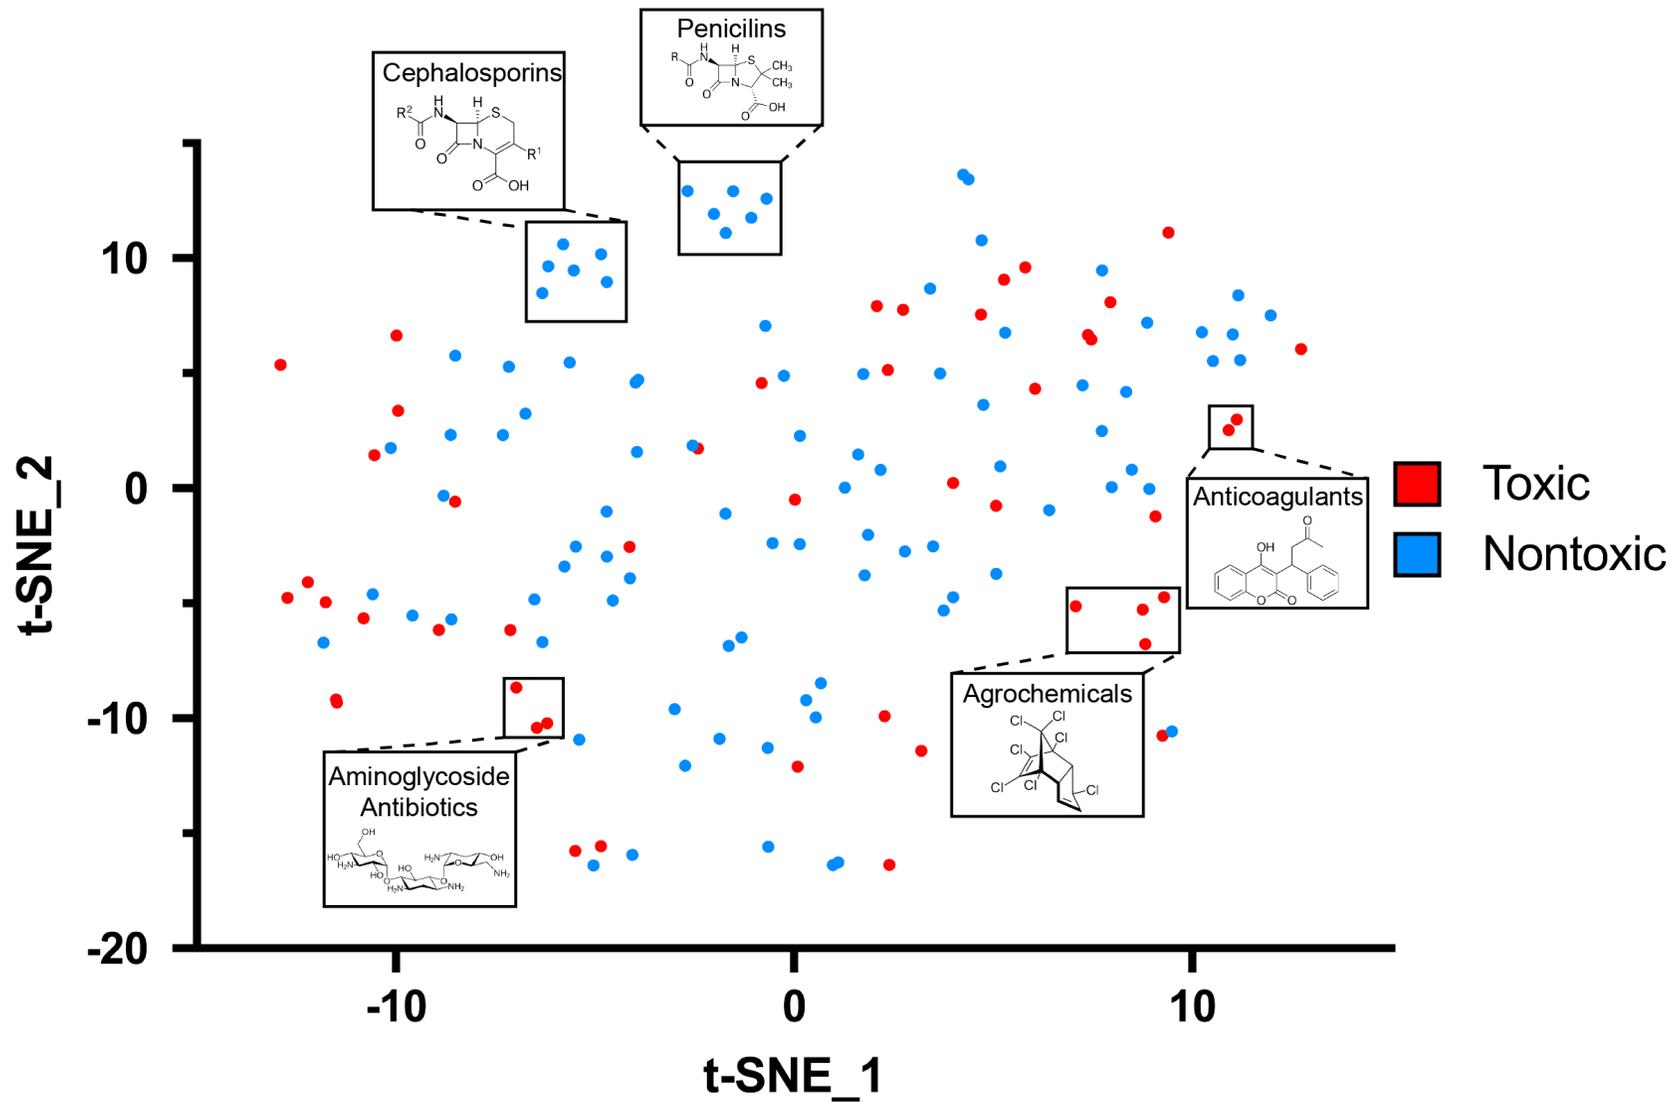

Evaluated collected literature for **overall** and **trimester-specific** developmental toxicity

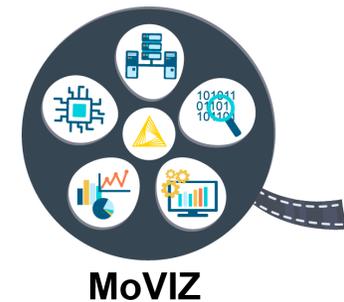

384 Compounds Collected After Curation and Activity Verification

Chemical Space Analysis: Class-Specific Grouping

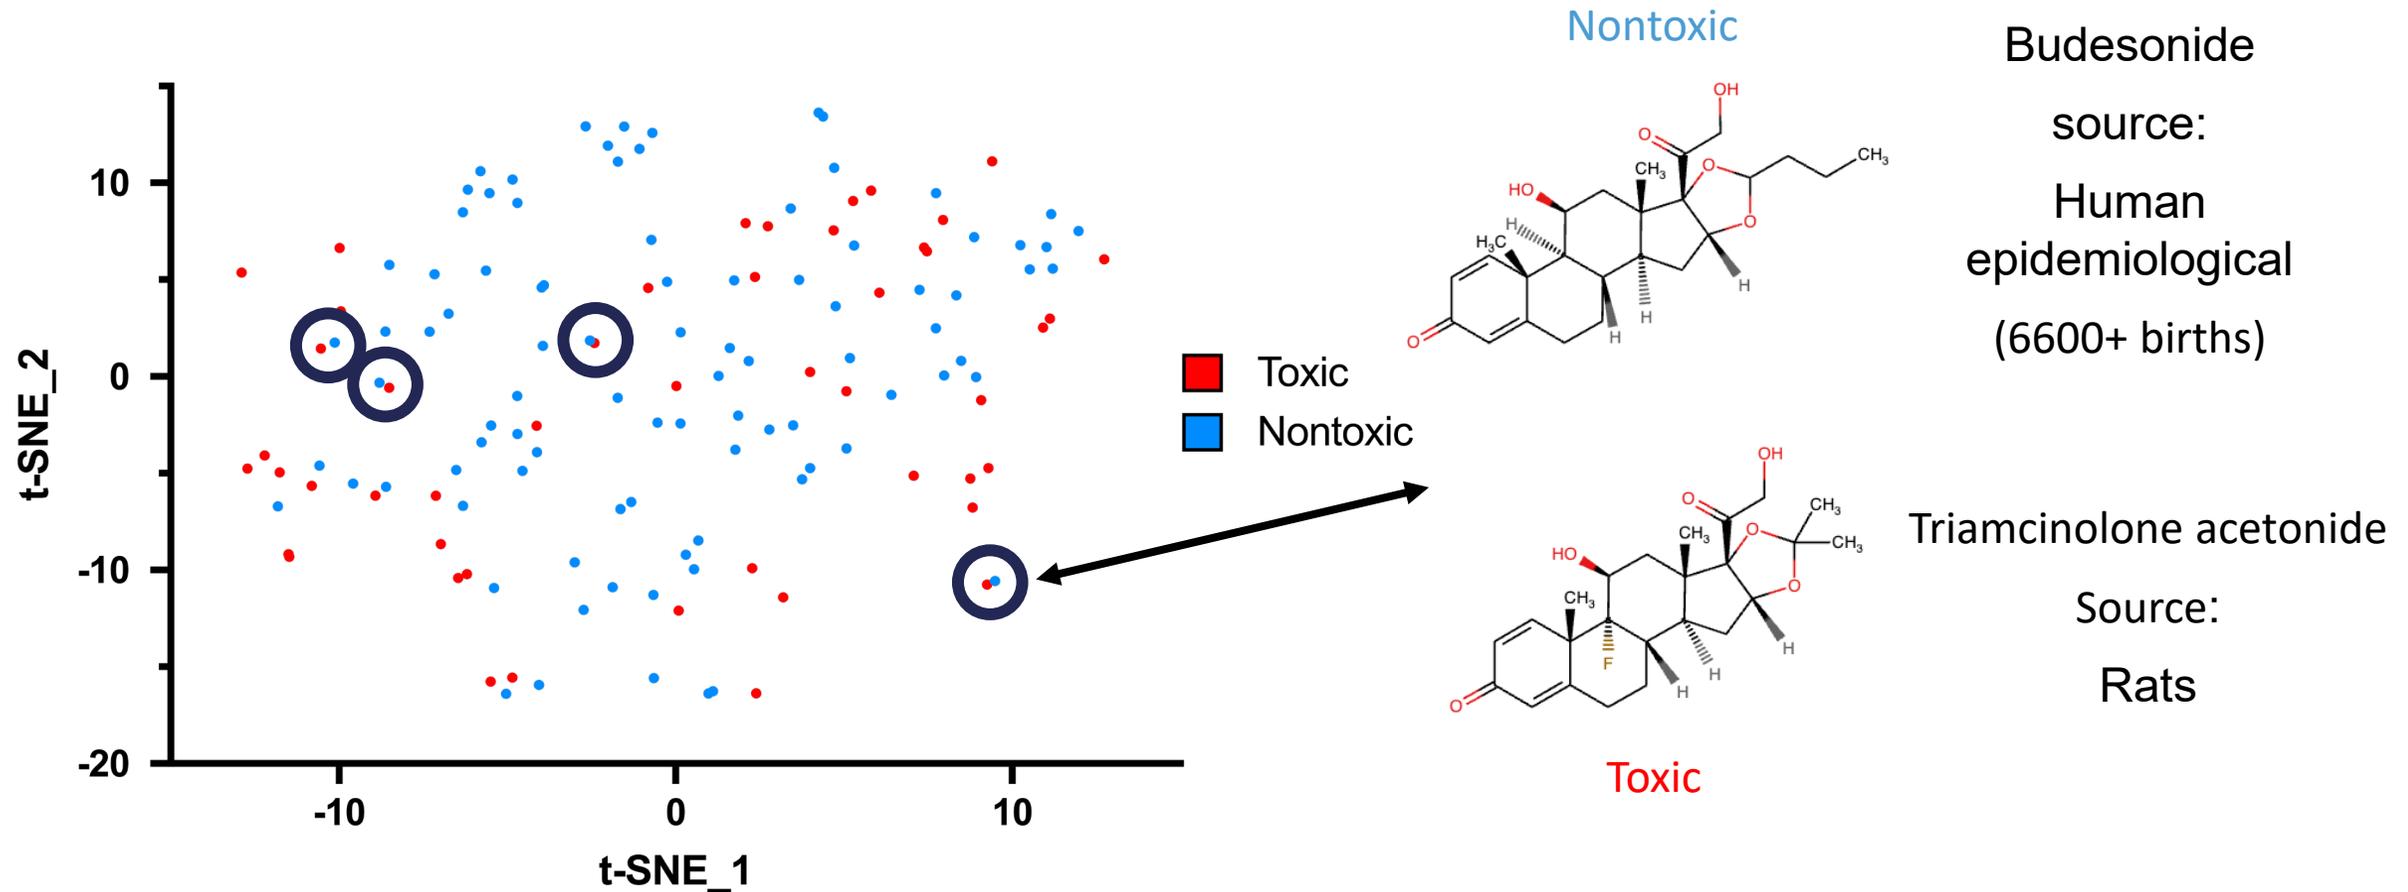

- Supervised Classification
- Morgan descriptors 2048 bits and radius 2
- Filtered low var. descriptors.
- Dimensionality reduction using SVM.

Moreira-Filho, J. et al *J Cheminform* 2024, 16 (1), 101.

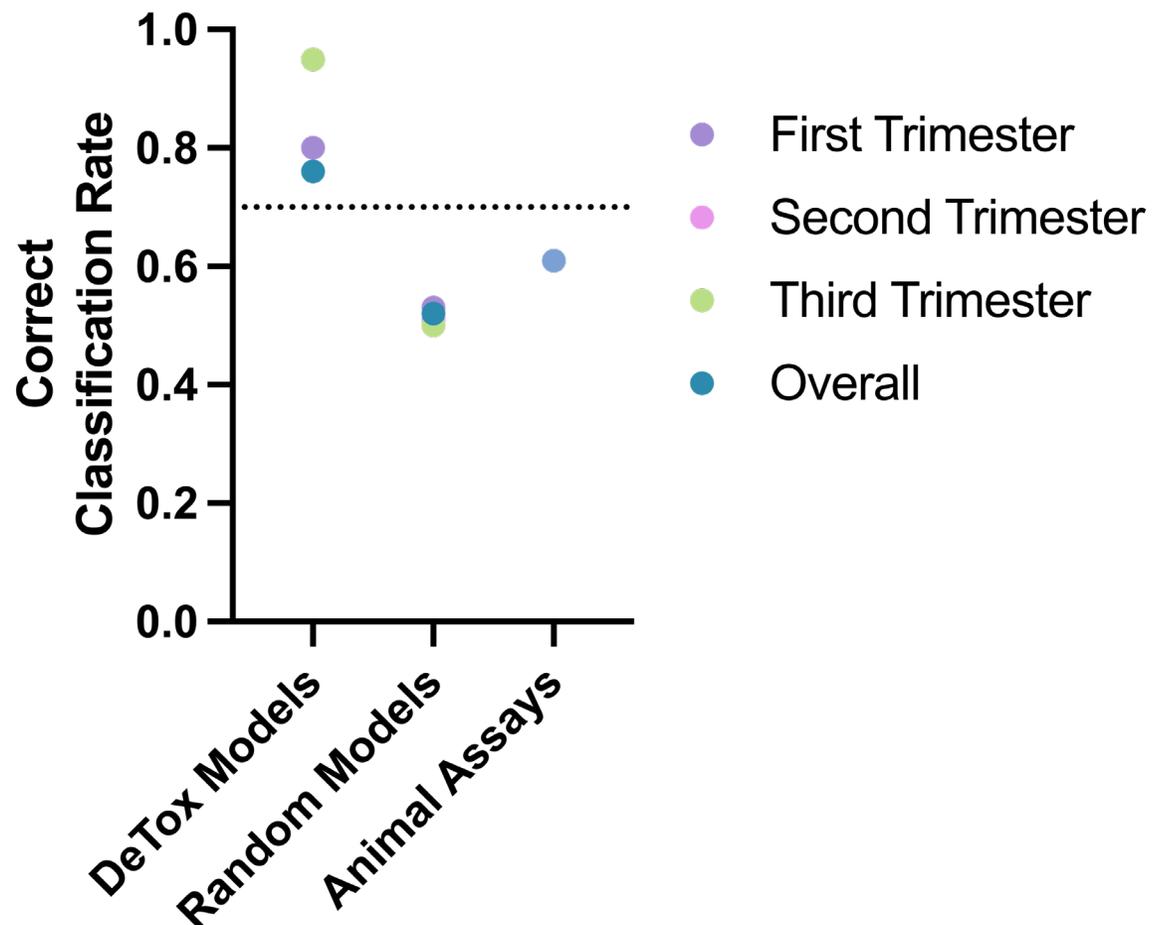

Chemical Space Analysis Reveals Few Activity Cliffs

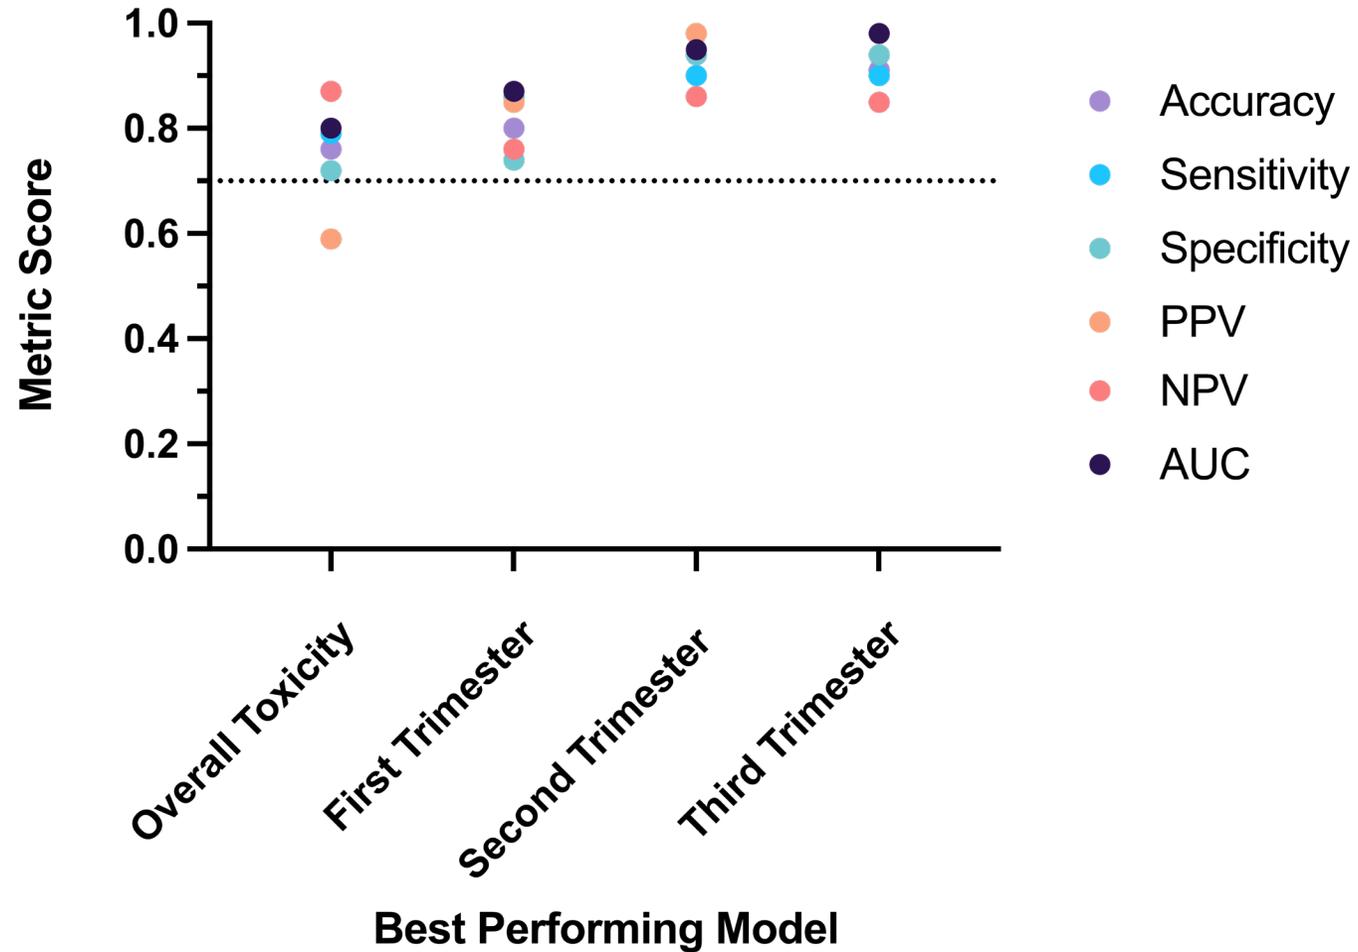

Moreira-Filho, J. et al *J Cheminform* 2024, 16 (1), 101.

24 Binary Classification Models Developed

- 24 Binary Classification Models
- **Descriptors:**
 - Topological Fingerprints (ECFP4)
 - Structural Fingerprints (MACCS)
- **ML Algorithms:**
 -  • Random Forest (RF)
 - Light Gradient-Boosting Machine (LightGBM)
 -  • Support Vector Machine (SVM)

Get Report with
Fragment Contribution Maps

This is an online web portal to predict developmental toxicity, described in "PregPred: an In-Silico Alternative to Animal Testing for Predicting Developmental Toxicity Potential". To use, enter SMILES in the box below, or draw a compound and hit load SMILES, then click "Get Properties". Results will appear below. By default all models for all endpoints will be run. You can choose to turn off certain endpoints in the options sidebar. Fragment contribution maps are generated with RDKit. To turn on the maps, check the "Display contribution maps" in the options sidebar. It defaults to off because the maps will increase the runtime significantly, so if using please be patient. More information about these maps can be found [here](#).

For the applicability domain calculation (AD), an ensemble confidence approach is used such that if the average prediction confidence of the ensemble of models is above 0.6, the prediction is considered "inside" the AD

Please cite "PregPred: an In-Silico Alternative to Animal Testing for Predicting Developmental Toxicity Potential". Models and code for this webserver can be found [here](#).

You can also generate a CSV of the results by entering the compounds below, separated by commas or new lines. fragment contribution maps will not be generated for CSV. Large numbers of SMILES and models will take a long time to process, be patient.

Model Options

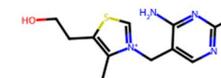

- Calculate AD
- Display Fragment Contribution Maps

Enabled Models

- Overall Toxicity
- First Trimester Toxicity
- Second Trimester Toxicity
- Third Trimester Toxicity
